

# Memory Mapped IO used for GPIO

Lecture 2

# Accessing Peripherals

- Memory Mapped I/O
  - GPIO Peripheral
- Embedded Rust Stack
- `embassy-rs`

# MMIO

Memory Mapped Input Output

# 8 bit processor

a simple 8 bit processor with a text display

# The Bus

example for RP2

1. **Memory Controller** asks for data transfer
2. **Internal Bus Routes** the request
  - to the *External Bus* or
  - to the *Internal Peripherals*
3. **External Bus Routes** the request based on the *Address Mapping Table*
  1. to **RAM**
  2. to **Flash**
  3. to an **External Peripheral**

# STM32L0x2

A real MCU

# System Control Registers

Cortex-M0+<sup>[1]</sup> SCR Peripheral @0xe000\_0000

Compute the actual address

$$e000\_0000_{(16)} + register\_offset$$

Register Examples:

- SYST\_CSR: **0xe000\_e010** ( $0xe000\_0000 + 0xe010$ )
- CPUID: **0xe000\_ed00** ( $0xe000\_0000 + 0xed00$ )

```
const SYS_CTRL_ADDR: usize = 0xe000_0000;
const CPUID_OFFSET: usize = 0xed00;

let cpuid_reg = (SYS_CTRL_ADDR+CPUID_OFFSET) as *const u32;
let cpuid_value = unsafe { *cpuid_reg };
// or
let cpuid_value = unsafe { cpuid_reg.read() };
```

⚠ Compilers optimize code and processors use cache!

1. Cortex-M33 has some additional registers ←

# Compiler Optimization

compilers optimize code

Write bytes to the `UART` (serial port) data register

```
1 // we use mut as we need to write to it
2 const UART_TX: *mut u8 = 0x4003_4000 as *mut u8;
3 // b".." means ASCII string (Rust uses UTF-8 strings by default)
4 for character in b"Hello, World".iter() {
5     // character is &char, so we use *character to get the value
6     unsafe { UART_TX.write(*character); }
7 }
```

1. The compiler does not know that `UART_TX` is a register and uses it as a memory address.
2. Writing several values to the same memory address will result in having the last value stored at that address.
3. The compiler optimizes the code write the value

```
1 const UART_TX: *mut u8 = 0x4003_4000;
2 unsafe { UART_TX.write(b'd'); }
```

# No Compiler Optimization

CPUID: `0xe000_ed00` (`0xe000_0000 + 0xed00`)

```
use core::ptr::read_volatile;

const SYS_CTRL_ADDR: usize = 0xe000_0000;
const CPUID_OFST: usize = 0xed00;

let cpuid_reg = (SYS_CTRL_ADDR + CPUID_OFST) as *const u32;
unsafe {
    // avoid compiler optimization
    read_volatile(cpuid_reg)
}
```

`read_volatile`,  
`write_volatile`

**no compiler  
optimization**

`read`, `write`, `*p`

**use compiler  
optimization**

| 0xed14 | <a href="#">CCR</a>        | Configuration and Control Register               |

# No Compiler Optimization

Write bytes to the `UART` (serial port) data register

```
1  use core::ptr::write_volatile;
2
3  // we use mut as we need to write to it
4  const UART_TX: *mut u8 = 0x4003_4000 as *mut u8;
5  // b".." means ASCII string (Rust uses UTF-8 strings by default)
6  for character in b"Hello, World".iter() {
7      // character is &char, so we use *character to get the value
8      unsafe { write_volatile(UART_TX, *character); }
9  }
```

The compiler **knows** that `UART_TX` **must be written** every time.

# 8 bit processor

with cache

# No Cache or Flush Cache

- Cache types:
  - *write-through* - data is written to the cache and to the main memory (bus)
  - *write-back* - data is written to the cache and later to the main memory (bus)
- few Cortex-M MCUs have cache
- the Memory Mapped I/O region is set as *nocache*
- for chips that use cache
  - *nocache* regions have to be set manually (if MCU knows)
  - or, the cache has to be flushed before a `volatile_read` and after a `volatile_write`
  - beware DMA controllers that can't see the cache contents

# Read the CPUID

About the MCU

```
use core::ptr::read_volatile;

const SYS_CTRL_ADDR: usize = 0xe000_0000;
const CPUID_OFST: usize = 0xed00;

let cpuid_reg = (SYS_CTRL_ADDR+CPUID_OFST) as *const u32;
let cpuid_value = unsafe {
    read_volatile(cpuid_reg)
};

// shift right 24 bits and keep only the last 8 bits
let variant = (cpuid_value >> 24) & 0b1111_1111;

// shift right 16 bits and keep only the last 4 bits
let architecture = (cpuid_value >> 16) & 0b1111;

// shift right 4 bits and keep only the last 12 bits
let part_no = (cpuid_value >> 4) & 0b1111_1111_1111;

// shift right 0 bits and keep only the last 4 bits
let revision = (cpuid_value >> 0) & 0b1111;
```

|-------|-----------|----------------------------------------------------------------------------------------------------------|------|--------|
| 31:16 | VECTKEY   | Register key:<br>Reads as Unknown<br>On writes, write 0x05FA to VECTKEY, otherwise the write is ignored. | RW   | 0x0000 |
| 15    | ENDIANESS | Data endianness implemented:<br>0 = Little-endian.                                                       | RO   | 0x0    |
| 14:3  | Reserved. | -                                                                                                        | -    | -      |

| Bits | Name          | Description                                                                                                                                                                                                                                                                                                                               | Type | Reset |
|------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 2    | SYSRESETREQ   | Writing 1 to this bit causes the SYSRESETREQ signal to the outer system to be asserted to request a reset. The intention is to force a large system reset of all major components except for debug. The C_HALT bit in the DHCSR is cleared as a result of the system reset requested. The debugger does not lose contact with the device. | RW   | 0x0   |
| 1    | VECTCLRACTIVE | Clears all active state information for fixed and configurable exceptions. This bit: is self-clearing, can only be set by the DAP when the core is halted. When set: clears all active exception status of the processor, forces a return to Thread mode, forces an IPSR of 0. A debugger must re-initialize the stack.                   | RW   | 0x0   |
| 0    | Reserved.     | -                                                                                                                                                                                                                                                                                                                                         | -    | -     |

# Read and Write

they do stuff

- Read
  - reads the value of a register
  - might ask the peripheral to do something
- Write
  - writes the value to a register
  - might ask the peripheral to do something
    - SYSRESETREQ

  - Section 2.19 - *GPIO* (except Interrupts)

# RP2040 GPIO Pins

GPIO pins are connected to the processor pins through three peripherals

# GPIO

## Peripherals

SIO

Single Cycle Input/Output, is able to control the GPIO pins

GPIO

Multiplexes the functions of the GPIO pins

*SIO*: Set the pin as Input or Output

*IO Bank (GPIO)*: Use the correct MUX function (F5)

*PAD*: Set the pin input and output parameters

# SIO Registers

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

| 0    | SLEWFAST | Slew rate control. 1 = Fast, 0 = Slow                                | RW   | 0x0   |

# Input

read the value from pin  $x$

- set the FUNCSEL field of GPIOx\_CTRL to 5
- set the GPIO\_OE\_CLR bit  $x$  to 1
- read the GPIO\_IN bit  $x$
- *adjust the GPIOx fields to set the pull up/down resistor*

# Output

write a value to pin  $x$

- set the FUNCSEL field of GPIOx\_CTRL to 5
- set the GPIO\_OE\_SET bit  $x$  to 1
- if the value
  - is 0, set the GPIO\_OUT\_CLR bit  $x$  to 1
  - is 1, set the GPIO\_OUT\_SET bit  $x$  to 1
- *adjust the GPIOx fields to set the output current*

| PAC                       | Accesses registers, usually created automatically from SVD files - <code>rp2040_pac</code> , <code>rp-pac</code> |

# GPIO HAL

A set of standard traits

All devices should implement these traits for GPIO.

```
1 pub enum PinState {  
2     Low,  
3     High,  
4 }
```

## Input

```
pub trait InputPin: ErrorType {  
    // Required methods  
    fn is_high(&mut self) -> Result<bool, Self::Error>;  
    fn is_low(&mut self) -> Result<bool, Self::Error>;  
}
```

## Output

```
pub trait OutputPin: ErrorType {  
    // Required methods  
    fn set_low(&mut self) -> Result<(), Self::Error>;  
    fn set_high(&mut self) -> Result<(), Self::Error>;  
  
    // Provided method  
    fn set_state(&mut self, state: PinState) -> Result<(), Self::Error>;  
}
```

# Bare metal

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use cortex_m_rt::entry;
5  use core::panic::PanicInfo;
6
7  #[entry]
8  fn main() -> ! {
9      // your code goes here
10
11      loop { }
12  }
13
14  #[panic_handler]
15  pub fn panic(_info: &PanicInfo) -> ! {
16      loop { }
17  }
```

## Rules

1. never exit the `main` function
2. add a panic handler that does not exit

# Bare metal without PAC & HAL

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use core::ptr::{read_volatile, write_volatile};
5  use cortex_m_rt::entry;
6  use core::panic::PanicInfo;
7
8  const GPIOX_CTRL: u32 = 0x4001_4004;
9  const GPIO_OE_SET: *mut u32 = 0xd000_0024 as *mut u32;
10 const GPIO_OUT_SET: *mut u32 = 0xd000_0014 as *mut u32;
11 const GPIO_OUT_CLR: *mut u32 = 0xd000_0018 as *mut u32;
12
13 #[panic_handler]
14 pub fn panic(_info: &PanicInfo) -> ! {
15     loop { }
16 }
```

```
18 #[entry]
19 fn main() -> ! {
20     let gpio_ctrl = (GPIOX_CTRL + 8 * pin) as *mut u32;
21     unsafe {
22         write_volatile(gpio_ctrl, 5);
23         write_volatile(GPIO_OE_SET, 1 << pin);
24         let reg = match value {
25             0 => GPIO_OUT_CLR,
26             _ => GPIO_OUT_SET
27         };
28         write_volatile(reg, 1 << pin);
29     };
30
31     loop { }
32 }
```

# embassy-rs

Embedded Asynchronous

# embassy-rs

- framework
- uses the rust-embedded-hal
- Features
  - Real-time
  - Low power
  - Networking
  - Bluetooth
  - USB
  - Bootloader and DFU

# GPIO Input

```
1  #![no_std]
2  #![no_main]
3
4  use embassy_executor::Spawner;
5  use embassy_rp::gpio;
6  use gpio::{Input, Pull};
7
8  #[embassy_executor::main]
9  async fn main(_spawner: Spawner) {
10     let p = embassy_rp::init(Default::default());
11     let pin = Input::new(p.PIN_3, Pull::Up);
12
13     if pin.is_high() {
14
15     } else {
16
17     }
18 }
```

The `main` function is called by the embassy-rs framework, so it can exit.

# GPIO Output

```
1  #![no_std]
2  #![no_main]
3
4  use embassy_executor::Spawner;
5  use embassy_rp::gpio;
6  use gpio::{Level, Output};
7
8  #[embassy_executor::main]
9  async fn main(_spawner: Spawner) {
10     let p = embassy_rp::init(Default::default());
11     let mut pin = Output::new(p.PIN_2, Level::Low);
12
13     pin.set_high();
14 }
```

The `main` function is called by the embassy-rs framework, so it can exit.

# Conclusion

we talked about

- Memory Mapped IO
- RP2040 GPIO
  - Single Cycle IO
  - IO Bank
  - Pad
- The Rust embedded standard stack
- Bare metal Rust
- The embassy-rs framework
